IN THE CLAIMS

No claim amendments are requested. The currently-pending claims are:

1. (Original) A method of processing packets in a switch comprising: selecting a first queue from at least three queues in a switch based on the cycle number (C) of a cycle;

flushing the first queue at the start of the cycle; receiving at least one isochronous packet over a bus during the cycle; placing the packet in a second queue based on the cycle number.

- 2. (Original) The method of claim 1 further comprising: transmitting the packet from the second queue after two cycles.
- 3. (Original) The method of claim 1 wherein the first queue is chosen from four queues.
- 4. (Original) The method of claim 1 wherein the first queue is associated with a cycle that has a cycle number of C minus 1.
- 5. (Previously Presented) The method of claim 1 wherein the first queue number is the same as the second queue number.
- 6. (Original) The method of claim 1 wherein the first queue number is equal to the remainder of (C-1)/n wherein n is the number of queues in the switch.
- 7. (Original) The method of claim 1 wherein the second queue number is equal to the remainder of (C+2)/n wherein n is the number of queues in the switch.
- 8. (Original) The method of claim 1 further comprising:

transmitting packets in cycle C from a third queue wherein the queue number of the third queue is equal to the remainder of C/n wherein n is the number of queues in the switch.

- 9. (Original) The method of claim 1 further comprising: setting a free pointer in the first queue to 0 at the end of the cycle; and setting a used pointer in the first queue to 0.
- 10. (Original) The method of claim 1 further comprising: setting a used pointer in the second queue to 0 at the end of the cycle; and setting a free pointer in the second queue to n.
- 11. (Previously Presented) A system of processing packets in a bus switch comprising:

means for storing data in queues;

means for selecting appropriate queuing means for each set of incoming data based on a cycle number in which the set of data arrive;

means for directing the set of incoming data to the appropriate queuing means; and

means for flushing data from the queuing means at the start of a cycle.

- 12. (Original) The system of claim 11 further comprising means for receiving the incoming data and wherein the incoming data includes isochronous packets.
- 13. (Previously Presented) A switch in a network comprising:
 a buffer memory including at least three egress queues; and
 a processor to direct incoming isochronous packets into one of the egress queues
 based on a cycle number of the switch and to flush another of the egress queues based
 on the cycle number.

- 14. (Original) The switch of claim 13 wherein the switch is configured to be used with at least one bus.
- 15. (Original) The switch of claim 13 wherein the switch is configured to be used with a connection selected from the group: ethernet bus, asynchronous transfer mode bus, IEEE 1394 standard bus, T-1, T-3, and OC-X.
- 16. (Original) The switch of claim 13 further comprising: at least one ingress port; and at least one egress port wherein each egress port is associated with at least three egress queues.
- 17. (Original) The switch of claim 16 wherein the egress queues store data to be transmitted by the processor from each egress port.
- 18. (Original) The switch of claim 13 wherein the buffer memory includes four queues.
- 19. (Original) The switch of claim 13 wherein the processor is configured to direct the incoming isochronous packets into the egress queue number equal to the remainder of (C + 2)/n wherein n is the number of queues in the switch.
- 20. (Original) The switch of claim 13 wherein the processor is configured to flush the egress queue number equal to the remainder of (C 1)/n wherein n is the number of queues in the switch.
- 21. (Original) The switch of claim 13 wherein the processor is configured to transmit the isochronous packets from the egress queue number equal to the remainder of C/n wherein n is the number of queues in the switch.
